

1056 CONT

...idity is only slight: in 12.58% of cases the temperature was elevated on one day and also in 12.58% of the cases for more than one day. Nine cases showed a fever of more than 38° for more than 3 days. The indications for manual exploration were placental retention (30.44%), suspicion of placental retention (48.09%) and haemorrhage due to uterine atony (12.45%).

BULG.

✓ Morphological and histochemical study of lipides in yolk globules. A. Khadzhiblov, G. Boyadzhiev, V. Dokov, and B. Chankarov. *Compt. rend. acad. bulgare sci.* 7, No. 1, 49-51(1954).—The distribution of lipides in the yolk globules of nonincubated hen eggs was studied by fixation of egg films with $HCHO$ or $K_2Cr_2O_7$ and subsequent staining. Yolk globules stained intensely with Sudan III or Nile blue in the periphery, but only slightly in the central part which showed a typical granulation and in some cases a vividly sudanophilous bubble. The central part was counter-stained with hematoxylin, methylene blue, or acid fuchsin, after which the sudanophilous bubble appeared as a nucleolus. Treatment with lipid solvents removed the Sudan staining material. The results are taken as evidence for a morphological organization of the lipid component of the yolk and yolk globules. J. A. Bain
